#### **NEW QUESTION: 1**

Which two Cisco IOS AAA features are available with the local database? (Choose two.)

- A. command authorization
- B. network access authentication
- C. network access authorization
- D. network accounting

**Answer: A,B**

Explanation:

#### Configuring the Local Database

This section describes how to manage users in the local database. You can use the local database for CLI access authentication, privileged mode authentication, command authorization, network access authentication, and VPN authentication and authorization. You cannot use the local database for network access authorization. The local database does not support accounting.

**Answer: C**

Explanation:

Explanation

The "aaa authentication login default local group tacacs+" command is broken down as follows:

- + The 'aaa authentication' part is simply saying we want to configure authentication settings.
- + The 'login' is stating that we want to prompt for a username/password when a connection is made to the device.
- + The 'default' means we want to apply for all login connections (such as tty, vty, console and aux). If we use this keyword, we don't need to configure anything else under tty, vty and aux lines. If we don't use this keyword then we have to specify which line(s) we want to apply the authentication feature.
- + The 'local group tacacs+' means all users are authenticated using router's local database (the first method). If the credentials are not found on the local database, then the TACACS+ server is used (the second method).
